Quadrature demodulation uses two reference signals separated by 90° of phase, along with two multipliers and two low-pass filters, to generate I and Q demodulated waveforms. Quadrature demodulation can be used to make an AM demodulator that is compatible with lack of phase synchronization between transmitter and receiver.

Furthermore, we now have the word “quadrature” applied to both a signal and the modulation/demodulation techniques associated with that signal. In any event, “in-phase” and “quadrature” refer to two sinusoids that have the same frequency and are 90° out of phase.

Introduction to Modulation and Demodulation The purpose of a communication system is to transfer information from a source to a destination. In practice, problems arise in baseband transmissions, the major cases being: • Noise in the system – external noise and circuit noise reduces the signal-to-noise (S/N) ratio at the receiver

Modulation changes a higher frequency carrier signal in proportion to a lower frequency message, or information, signal. I/Q data is highly prevalent in RF communications systems, and more generally in signal modulation, because it is a convenient way to modulate signals.

What is I/Q Data? - National Instruments

Demodulation is extracting the original information-bearing signal from a carrier wave. A demodulator is an electronic circuit (or computer program in a software-defined radio) that is used to recover the information content from the modulated carrier wave. There are many types of modulation so there are many types of demodulators. The signal output from a demodulator may represent sound (an ...

Frequency demodulator without arctangent: (a) standard process; (b) simplified process. The implementation of this algorithm, where the derivatives of $i(n)$ and $q(n)$ are $i'(n)$ and $q'(n)$ respectively, is shown in Figure 13-61(a). The $\Delta\phi(n)$ output sequence is used in Eq. (13-111) to compute instantaneous frequency.

Why do we need Modulation/Demodulation? Example: Radio transmission Voice Microphone Electric signal, 20 Hz - 20 KHz Transmitter Antenna: Size requirement $> 1/10$ wavelength At 3 KHz: Antenna too large! Use modulation to transfer information to a higher frequency $\lambda = c/f = 3 \times 10^8 / 3 \times 10^3 = 100\text{m}$ $\Rightarrow \lambda = 100\text{m}$ 3 Flynn/Katz 7/8/10

Introduction to Digital Modulation Analysis

IQ/IR/SSB mixers are based on vectorial cancellation, and as such are subject to the limits of phase and amplitude balance. In an IQ mixer the 'sideband rejection' refers to how well the I signal will be suppressed in the Q channel and vice versa. This is typically around 20-30 dB for very good broadband IQ mixers.

QAM demodulator basics. The QAM demodulator is very much the reverse of the QAM modulator. The signals enter the system, they are split and each side is applied to a mixer. One half has the in-phase local oscillator applied and the other half has the quadrature oscillator signal applied. Basic QAM I-Q demodulator circuit

The IQ demodulation preserves the information content in the Band-pass signal, and the original RF-signal can be reconstructed from the IQ-signal. The next chapter explains how to reconstruct the RF-signal from the IQ-signal.
